THE  
DISPOSABLE  
FEEDING  
BOTTLES

## DISPOSABLE PRESSURE FEEDING BOTTLES 100 ml - 250 ml

Our Company, Labor Bay Srl, was the first in Italy to produce sterile, disposable feeding bottles and today remains the market leader thanks to the commitment of all our employees making a safe and easy to use product.

This product has been used in the majority of Italian Neonatology

units over the past 40 years. Physicians and nurses alike consider it convenient, fit for purpose and appropriately priced.

The graduated feeding bottles with a pressure cap are available in two sizes, 100 ml and 250 ml. They meet the European Regulations for plastic food containers as well as EN 14350.

## TEATS

We have manufactured silicone teats for feeding bottles since 2006, to overcome the increasing incidence of latex allergy. Our teats are compatible with both pressure and ring nut and cap bottles.

This teat combines quality and ease of use, as is our tradition, to offer a cutting edge product manufactured with high quality materials and

state of the art procedures. Our teats are laser pierced ensuring precision and repeatability of holes diameter. Our laser technology allows changes in the number, shape and diameter of the holes. Our teats meet both the European Regulations for food devices as well as EN 14350.

## DISPOSABLE FEEDING BOTTLES WITH RING NUT CAP

60 ml - 100 ml - 250 ml

We make disposable feeding bottles with caps in three sizes, 60 ml, 100 ml and 250 ml, to fulfil the requirements of Neonatology units as well as Nurseries.

These products are made of the latest generation of transparent polyethylene using a unique laser

process etching a clear, indelible graduated scale for ease of reading. The feeding bottles can be used between -20 and 80 C, therefore suitable for pasteurization and freezing.

The feeding bottles with cap meet both the European Regulations for plastic food containers as well as EN 14350.

## STERILIZATION

Feeding bottles and teats are sterilized effectively with beta radiation, to ensure safety whilst avoiding dangers of ETO sterilization.

The products are packed in sealed bags to ensure the efficacy of sterilization.

## HYGIENE

Feeding bottles and teats are disposable and ready to use. This provides a safe product, easy to use system which improves work flow and avoids hazards of washing and re-sterilization.

We are especially careful with the

cap of the ring nut teats to avoid accidental contamination of the teats.

## ENVIRONMENT

Labor Baby is an environment friendly company with up to 70% of the energy used coming from sustainable sources.

In order to preserve the environment for future generations we decided to use protective processes including:

- Beta radiation sterilization since '70s, without using chemicals
- Laser etching on feeding bottles, without using harmful inks
- Plastic can be recycled or burnt without toxic emissions.
